

Systems Implementation, Inc.

IBM System i Servers

Hardware Platform

HIGHLIGHTS

- Unmatched system reliability/availability
- Security
 - Resistant to viruses
- Simplicity in management and operation
- Robust, integrated database
- Integrated report writer
- Low total cost of ownership
- Flexible, versatile, multi-environment support

The IBM System i lets customers manage their businesses instead of their computers.

Overview

The IBM System i Server platform gives you freedom – freedom from unneeded complexity. Freedom to resist viruses. Freedom from high ownership costs. Freedom to manage your systems easily and effectively. Freedom from low ROI. In short, the freedom to focus on your business, rather than your technology.

The innovative technology of the IBM i line allows businesses to exploit new technologies while providing robust security and virus resistance. In addition, superior application flexibility lets businesses choose the best applications and /or operating systems to meet their needs. And finally, with a set of new e-business tools, IBM i customers can run their IT infrastructures efficiently and effectively – from managing multiple workloads to testing new solutions.

The bottom line? IBM i Servers allow customers the freedom to succeed.

Innovative Technology

IBM System i Servers offer long-term maximization of existing software investments, while allowing you to capitalize on new e-business opportunities through rapidly deployed Web-enabled applications. The System i's high performance 64-bit architecture frees applications from hardware dependency so you can exploit new technologies – without having to rewrite or replace your applications.

No need to worry about virus attacks. The System i's unique architecture permanently tags a new object as either data or a program to help prevent it from disguising itself and harming your system.

Easy management - anywhere, anytime. Dynamic resource allocation and enhanced clustering options provide high levels of availability, while sophisticated wireless console management frees operators from the machine room.

Integrated Microsoft Windows support. The Integrated IBM System i Server allows you to run multiple Windows® servers from within or directly attached to your iSeries.

Say good-bye to server farms. Advanced logical partitioning and workload subsystem management options let you balance multiple workloads – independent of each other – all in one server footprint. This means lower operating costs and improved user service levels.

“ The IBM hardware the software runs on is an important component of this solution.

Our business has come to depend on the software, and because the system is so reliable, we never experience any downtime.

It just runs and runs. ”

- Gerry Boyd
Vice-President
Teltronic, Inc.

Application Flexibility

With IBM i, it's not necessary to think your hardware platform will run only those applications written for it. The system supports a variety of different operating systems such as Windows, Linux[®], UNIX[®] and OS/400[®], as well as application environments and languages such as Java[™], WebSphere[®], and PHP[™], so you are free to put your business needs ahead of those of your IT infrastructure.

Choose the best applications for your business, and let the IBM System i do the rest. Ease of operation, low total cost of ownership and high ROI. Isn't that what every company looks for in a server? The IBM System i delivers!

New tools for e-business

IBM i delivers a wide range of tools to help customers manage today's e-business – including servers, storage, software, services, technical support, education, and financing. What's unique about the IBM i is its integrated design – offering new ways to manage end-to-end growth, risks and costs across multiple servers as well as an entire network – all in one server footprint.

Systems Management Advantage: advanced solutions to help ensure the availability and viability of hardware, software and business-critical data.

Customer Care Advantage: legendary worldwide customer support, Web-based capacity and performance monitoring, online support and learning services.

Availability Advantage: end-to-end high availability services across hardware and software.

Capacity Advantage: unpredictable growth management with minimal risk.

Solution Assurance Advantage: proper assessment and successful implementation of solutions – over 130 testing centers around the world.

Financing Advantage: custom financing options to fit individual needs and budgets.
